Attn: Mr. Kai Stephan, CEO

**Subject: Pegasus Solar™ LightSpeed Rail-Less Solar Mounting System Structural Analysis for Concrete Tile Roofs**

SML Job No.: 182-15

Dear Mr. Stephan:

We have analyzed the Pegasus Solar™ LightSpeed rail-less photovoltaic (PV) panel roof mount system for its use on concrete tile roofs and determined that, for the configurations and criteria described below, it is in compliance with the applicable sections of the following reference documents:

- Codes: ASCE/SEI 7-05 & 7-10 Min. Design Loads for Buildings & Other Structures  
California Building Code 2010, 2013 & 2016 Edition  
California Residential Building Code 2010, 2013 & 2016 Edition
- Other: Aluminum Design Manual, ADM1-2010 & 2015 Edition

The Pegasus Solar™ LightSpeed rail-less photovoltaic (PV) panel roof mount system for concrete tile roof installations is comprised of a 6000 series aluminum clamp assembly, standoff, extension and corner connectors, steel sled, cold-formed steel flashing, 5/16-18 stainless steel bolts and nuts to fasten the mounting system together, and the system is attached to the roof wood rafters or truss top chords with (2) 5/16" diameter x 3.5" long 18-8 stainless steel wood lag screws.

We tested the mounting system with the (2) 5/16" diameter 18-8 stainless steel wood lag screws passing through metal flashing, 15/32" thick plywood and finally penetrating 2.0" (see table note 4) into 2x SPF #2 in the center third of the 1.5" wide face to model either a 1.5" wide roof truss top chord or roof rafter.

The test report no. 2165XD163-5, dated January 7, 2017, by Western Technologies shows that the critical failure occurs in primarily one of two ways; pullout of the wood lag screws in tension from the 2x wood framing for both the tension and lateral tests and fracturing of the cast aluminum arm at the arm flange in compression loading. Maximum allowable values for these failure conditions were derived using a safety factor of 3.0 for the wood lag screw pullout failure based on ICC AC13 and safety factor 2.0 for aluminum failure based on ADM 2010 & 2015 on

the yield and ultimate loads provided by the testing. The allowable tension, compression and lateral values were further reduced to limit the deflection to no more than 2 inches, therefore the maximum allowable tension (uplift), compression and lateral shear forces are taken as 328 lb (5.8 safety factor), 771 lb and 344 lb (4.3 safety factor) respectively. The maximum allowable moment capacity of the 35 mm and 40 mm corner brackets is 341 ft-lb based on Western Technologies testing with a safety factor of 1.85, again based on ADM 2010 & 2015. The 2.5 inch wide by 0.5 inch thick aluminum ‘Double Mount’ adds 257 ft-lb of moment capacity when used and can increase the allowable spacing as indicated in the attached tables, see table note 6.

For the landscape orientation, the downward normal pressures on the PV panels were limited to 113 psf (5400 Pa) for spans up to 4 feet and 50.1 psf (2400 Pa) for spans up to 6 feet, and the upward normal pressures on the PV panels were limited to 50.1 psf (2400 Pa) for all spans. For the portrait orientation the downward and upward normal pressures on the PV panels were limited to 50.1 psf (2400 Pa) for all spans. These pressure limits comply with UL 1703.

The attached tables below show the maximum allowable mount spacing based on the interaction of the combined loading criteria of wind speed, roof slope, and snow loads which produce reaction loads below the combined interaction of the allowable loads listed above. The effect of seismic loads (for all design categories A-F) has been determined to be less than the effect due to wind or snow loads in all load conditions and combinations. The assumed topography is flat with a  $K_{zt} = 1.0$ . Therefore, the maximum allowable mount spacing for common load cases due to dead, wind and snow loads are the controlling load cases. Note: drifted and sliding snow is outside of the scope of this letter.

The maximum allowable cantilever, from the edge of the PV module to the center of the roof framing, is the smaller of 19 inches or ½ of the maximum mount spacing, as shown in tables 3 through table 43. A ‘Double Mount’ increases the allowable distance between the roof framing and the edge of the PV module by up to 7 additional inches, allowing the distance from the edge of the PV module to the roof framing centerline to be greater than 19 inches, while still maintaining the tested PV module cantilever restrictions, see table 2 below.

Roof Angle (Degrees)	Roof Slope (in/in)
0.0	0:12
4.8	1:12
9.5	2:12
14.0	3:12
18.4	4:12

Diagram RE1. Standard Interior has PV Modules on Both Sides, Standard Edge has PV Module on One Side Only.

Table Notes – Tabulated values are based on the following criteria:

1. ASCE 7-05 & 7-10: Building mean roof height = 30 ft maximum & Risk Category = II.
2. Solar panel maximum area = 21.9 square feet (79.75 in. x 39.5 in.) Landscape & 18.1 square feet (66 in. x 39.5 in.) Portrait.
3. Solar panel dead load = approximately 3.0 psf.
4. 2.0” minimum penetration of lag screw into 2x roof framing, excluding the tapered tip portion.
5. PV panel must comply with mechanical load requirements of UL 1703 OR 2703.
6. In the portrait tables, several combinations have two numbers in the cell and the second number has an asterisk before it (e.g. \*72) indicating that the ‘Double Mount’ may be used to increase the spacing to the number indicated, in inches. The ‘Double Mount’ shall only be used to increase the spacing as prescribed in the LightSpeed Mount Installation Manual.
7. ‘Edge Mounts’ are mounts supporting only one panel and ‘Interior Mounts’ are mounts supporting two panels, see Diagram RE1.
8. SPF #2 = Spruce-Pine-Fir #2 Grade.
